L6 ANSWER 8 OF 10 CAPLUS COPYRIGHT 2006 ACS on STN

AB The process for the manufacture of chlorendic anhydride (I) [115-27-5] by the Diels-Alder condensation of **hexachlorocyclopentadiene** [77-47-4] with **maleic anhydride** [108-31-6] was improved by carrying out the reaction in chlorobenzene [108-90-7] and precipitating I by addition of straight-run naphtha (b. 62-85.deg.). The temperature dependence of the solubility of I was determined in the two solvents and in their 1:4 mixture The I drying step was also examined in detail.

L6 ANSWER 9 OF 10 CAPLUS COPYRIGHT 2006 ACS on STN

AB Fire-resistant title resin compns. of low corrosiveness were prepared by Diels-Alder reaction of excess **maleic anhydride** (I) with **hexachlorocyclopentadiene** (II) to give chlorendic anhydride [115-27-5] at 130-60.deg., (catalytic) reaction with HOCH₂CH₂OH (III) with steam distillation before the acid number decreased to .sim. 40 for volatile component removal, polymerization at 150-61.deg., and addition of styrene [100-42-5]. Thus, 117 parts molten I was added to 200 parts II within 2 hr at 130.deg. and the mixture heated 4 hr at 144.deg.. Addition of 82 parts III within 1 hr at 137-67.deg. under N, heating 4 hr at 161.deg., steam distillation for 4 hr at 155-61.deg., and heating 10.5 hr at 150-60.deg. under N gave chlorendic anhydride-ethylene glycol copolymer (IV) [40620-96-0]. A composition containing 200 parts IV, 80 parts styrene, and 0.01% toluhydroquinone had corrosiveness (NACE Standard Test TM-01-06) to carbon steel 0.08 mils/year and peak exotherm 193.deg. vs. 4.71 mils/year and 173.deg. for a resin prepared without H₂O vapor distillation

AB 1,4,5,6,7,7-Hexachlorobicyclo[2.2.1]hept-5-ene-2,3-dicarboxylic acid anhydride (I) [115-27-5], useful in preparing thermosetting epoxy resins or polyesters, was prepared in >99.4% purity with high yields by treating **hexachlorocyclopentadiene** [77-47-4] with **maleic anhydride** [108-31-6] in a mixed solvent of saturated or unsatd. chloro-substituted hydrocarbon and benzene or alkylbenzene (5-50%) at 110-70.deg., and washing the I precipitate with the mixed solvent, which gave better results than either solvent alone.
